Shanmukh: I implemented the union and minus operation among the five fundamental operations. In order to do that, I had to complete the partially implemented union and minus methods under the Table class in the Table.java folder. I did not introduce any new class/method.

Rezwan: The given code stub had two kinds of join operations: equi-join and natural join. I implemented both. I did not change any other class apart from Table. I completed the partially implemented join functions. I had to write a new method named "remove_duplicate" to make the job easier.

Jaswanth: I implemented select and project operations. I had to modify the Table class. Inside the table class, there were two methods named select and project. It was partially written. I completed the rest of the methods. I did not change or modify any other file/class/method.
